Target segment: Indian college students aged 18–24

Frequent ChatGPT use among college students creates a clear opportunity for voice input.

Segments Considered & Research Priority

College students (18–24)	Assignments, concepts, exams and career prep	**Selected segment**
Job seekers and freshers	Resumes, applications and interview practice	**Medium**
Working professionals	Emails, reports and work queries	**Medium**
Content creators	Scripts, captions and idea generation	**Medium**
Regional language users	Everyday questions in their preferred language	**High, later phase**

4.50 Cr
students in Indian higher education

82.1%
of surveyed students used ChatGPT mobile at least three days a week

Why this segment

1. **Frequent need**
   32 of 39 surveyed students used ChatGPT mobile at least three days a week, showing frequent opportunities to enter study and career-related prompts.
2. **Voice opportunity**
   Assignments and detailed questions can be tiring to type, so dictation could reduce effort.
3. **Clear adoption gap**
   26 of 39 respondents used voice no more than twice in the past 30 days.

Research approach

Participants were aged 18–24, enrolled in an Indian college and had used ChatGPT mobile in the past 30 days. Of 42 submissions, 39 qualified for analysis and 6 students were interviewed.

Hypotheses

- **Typing habit:** Typing feels faster and more familiar
- **Accuracy:** Voice may capture words or accents incorrectly
- **Privacy:** Students may feel uncomfortable speaking near others
- **Task fit:** Precise or editable prompts are easier to type
- **Environment:** Noisy or shared places discourage speaking

Why students continue to prefer typing over voice input

39 valid survey responses and six interviews show that students prefer typing for greater control, easier correction and privacy.

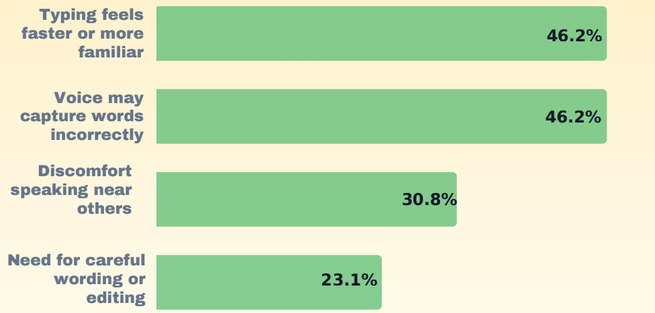

84.6%
Knew the microphone converts speech into a written prompt

66.7%
Used voice input only 0–2 times in the past 30 days

46.2%
Felt typing was quicker or more familiar

46.2%
Concerned that voice may capture words incorrectly

Main barriers reported (% of 39 respondents)

Each percentage shows the share of 39 students selecting that barrier. Multiple selections were allowed.

Voice input awareness and repeat use

Survey n=39

Knew the microphone converts speech into a written prompt	85%	33/39
Tried voice input at least once during the past 30 days	72%	28/39
Used voice input at least three times in 30 days	33%	13/39
Used voice input at least six times in 30 days	10%	4/39

Awareness is high, but regular voice use drops sharply after trial.

Which hypotheses the research supported

Evidence from 39 survey responses and 6 interviews

- **Preference for familiar typing** — SUPPORTED
  18/39 chose typing because it felt faster or familiar. All 6 typed by default.
- **Concern about transcription errors** — SUPPORTED
  18/39 expected incorrect words. All 4 interviewed voice users made corrections.
- **Discomfort speaking near other people** — SUPPORTED
  12/39 felt uncomfortable. Three of six interviewees preferred voice when alone.
- **Voice suited only certain tasks** — SUPPORTED
  Two used it for long explanations, while two used it for quick questions.
- **Noisy or shared surroundings** — SECONDARY
  Only 4/39 selected this, making it a less common barrier.

Key insight **Students use voice for convenience, but return to typing for precise wording, easier corrections and privacy.**

Problem framing: Voice input feels less controllable than typing

Speaking near others feels uncomfortable, while transcription errors require extra checking and correction.

User	Indian college students aged 18–24 who use ChatGPT mobile for academic or career-related tasks.
Context	Students often use ChatGPT around classmates, friends or family. They also use it for tasks where prompts must be worded carefully.
Current behaviour	Students usually type their prompts and use voice only when they feel comfortable speaking and the task is suitable.
Pain points	Other people may hear the prompt, voice may capture words incorrectly, and fixing these errors requires extra time and effort.
Evidence	Among the 39 students surveyed, 26 used voice input no more than twice in the past 30 days. In addition, 18 said typing felt faster or more familiar, 18 were concerned about incorrect transcription, and 12 felt uncomfortable speaking near other people.
Root cause	Students need control over both privacy and wording. Voice input makes this harder in shared settings and when transcription errors require correction.
Impact	Students use voice input only occasionally instead of making it their regular way of entering prompts.

Problem statement

Indian college students struggle to use ChatGPT voice input regularly for study and career-related tasks, especially when they are around other people or need to word a prompt carefully. They prefer typing because it offers more privacy and makes mistakes easier to correct. As a result, voice input remains an occasional option rather than their usual way of entering prompts.
